

ABSTRACT OF THE DISCLOSURE

Temperature control is made without the risk of contaminating object-to-be-processed and with high accuracy. Temperatures are metered out of contact with the
5 objects-to-be-processed, and based on a metered result, estimated temperatures of the objects-to-be-processed are computed. Furthermore, estimation errors of the estimated temperatures are computed to correct the estimated temperatures. Based on a temperature recipe stating
10 relationships between set temperatures and times and the corrected estimated temperatures, a heater is controlled.
